

## My Dream Application.

Today, in this world full of technologies, we have been so dependent upon mobile devices and smartphones. The applications or apps within the devices are the magnets that attract the human beings towards it. Applications are the <sup>canvas</sup> playground for tech experts and developers to play and create their ideas and creativity. Today, you can find almost all the sectors incorporated into apps and I ~~doubt~~ <sup>believe</sup> that there is an app for almost everything you can think of. Still, a great question that can be asked to an individual is that, "If you could create an app, what would it be? and why?" This question can challenge your creativity and your capabilities into combining technology, business and ~~some~~ your sector of influence.

I, think applications as revolutions. About 10 years back, mobile phones and smartphones were things of luxury and today, they have almost become necessities. If we are so influenced by new innovations and ideas that ~~are~~ help ~~to~~ our daily lives directly or indirectly. If I could create an app, its name would be 'Agro-it' and as the name suggests the app is about agriculture and specifically about helping the farmers. I dream to revolutionize agriculture and making it commercial for the farmers to help make their profession advanced and tech-friendly. The app basically will have all the

agriculture related professions in one place. From farmers to supplier and other agricultural technician in one app. Farmers can buy seeds, fertilizers for their crops from the dealers and also consult the agro-technicians if they have issues in their farm. Appointments as well as text consultations will be available. Farmers will have the option to click pictures of diseases or insects that hamper their crops and send it to ~~to~~ technicians to inspect. This way, the farmers can get their services in one app as well as dealers and suppliers can sell their product through the app.

In countries like Nepal, ~~to~~ agriculture can be revolutionized with this app and farmers can be made tech-friendly. Trainings and workshops to use the app can help farmers familiar with the user-interface. In today's context, 'Agro-it' seeks to revolutionize agriculture.
